1. Welcome — what you own

You don't own "a website". You own a **complete, professional sales channel** for Sunflour Bakery — a mobile-first ordering platform that works for you 24 hours a day, takes orders while you sleep, and presents your bakery the way a serious brand deserves to be seen.

This is an **asset**, not a rented page. It is yours: your brand, your menu, your prices, your customers, and your data — with **no per-order commissions** to a third-party marketplace eating into your margins.

What it does for your customers

- Browse your official menu with photos, and **search** with live suggestions.
- Add items to a cart and choose **pickup** or **delivery**.
- See the **exact delivery fee before they pay** — no surprises, no disputes.
- Get clear **Moniepoint bank-transfer** instructions.
- Send **payment proof on WhatsApp** in one tap.
- View and download a proper **invoice** anytime.
- Leave a **review** — which you approve before it ever appears.

What it does for your business

The value	Why it matters
Your own storefront, 24/7	Customers order anytime, from any phone — you're open even when the shop is closed.
You keep your margins	No marketplace commissions. Every naira of the sale is yours.
A professional first impression	A clean, branded, fast site builds instant trust and makes Sunflour look established and serious.
Honest money handling	The platform never claims a payment is confirmed until <i>you</i> verify it — protecting your cash and your word.
Full operational control	One private Admin panel runs products, prices, images, delivery zones, payments, orders, reviews, emails, your team, and settings.
You own the relationship	Customer details, order history, and reviews live in <i>your</i> system — not a third party's.
Built to be found	Search-engine ready, so new customers can discover Sunflour on Google.

The one principle behind everything

The golden rule of this platform: it never tells a customer that payment is confirmed until *you* confirm it. This single discipline protects your money, keeps your promises honest, and is the reason customers will trust ordering from you again and again. Everything in the platform is built around that trust.

In short: this is the engine that turns Sunflour from a bakery people *visit* into a bakery people can *order from, anywhere, with confidence*.

2. Getting started

2.1 The two sides of your website

Side	Who uses it	Where
Public site	Your customers	your main web address
Admin panel	You and your staff	<code>/admin</code> on the same address

2.2 Signing in

1. Go to your website address and add `/sign-in` at the end.
2. Enter your admin email and password.
3. You'll land on the **Admin dashboard**.

If you don't have an admin account yet, see [Section 10 — Your team and access](#).

2.3 A quick tour of the Admin panel

Section	What you do there
Dashboard	See key numbers at a glance (orders, products, etc.)
Orders	Review orders, confirm payments, move orders forward
Products	Add/edit products, prices, variants, images, drafts
Categories	Organize products into menu groups
Tabular menu	The quick price-list reference customers can scan
Delivery	Manage delivery zones, fees, and the evening surcharge
Payment	Your Moniepoint transfer details shown at checkout
Email	See which emails were sent or are waiting
Reviews	Approve or reject customer reviews
Users	Add/remove staff and view registration codes
Settings	Business name, contact links, social media, content
Audit logs	A history of every important admin action

3. The customer journey

Understanding what your customer sees helps you support them.

1. **Home** — a warm, branded landing page with featured products.
2. **Menu** — they browse products (with photos) or switch to a **quick price list**, and can **search** with live suggestions.
3. **Product page** — full details, price, and "add to cart".
4. **Cart** — they review items and pick **pickup** or **delivery**.
5. **Checkout** — they enter details; the platform calculates the **exact total**, including any delivery fee and evening surcharge.
6. **Payment instructions** — they see your **Moniepoint** transfer details and a clear note that payment is *pending* until you confirm it.
7. **WhatsApp proof** — they tap a button to send you their payment proof.
8. **Invoice** — they can view/download their invoice anytime.
9. **Updates** — they receive emails as the order progresses (if email is on).

A first-time visitor also sees a short **welcome message** that appears once and stays quiet for 7 days.

4. Managing your menu

4.1 Categories

Create categories (e.g. *Cakes, Bread, Pastries*) under **Admin** → **Categories**. Categories control how products are grouped on the menu. Order matters — they appear in the sort order you set.

4.2 Products

Under **Admin** → **Products** you can:

- Add a product with a **name, description, category, and price**.

- Add **variants** (e.g. sizes) with their own prices.
- Upload **product images** (the first image is the main photo).
- Set a product as **popular** or **featured** (these surface on the home page).
- Mark a product **available** / **unavailable** without deleting it.

Prices are in Naira. Always double-check a price before saving — the price you set is the price customers pay. The platform never lets the customer's device change the price; the total is always recalculated on the server.

4.3 Drafts (save and finish later)

If you start adding a product but aren't ready to publish, it can be saved as a **draft** and finished later. Drafts are not visible to customers.

4.4 Images — keep them clean

Use clear, well-lit, square-ish photos. Good photos are the single biggest driver of appetite and trust. Avoid blurry or dark images.

4.5 The tabular menu

The **Tabular menu** is a fast, scannable price list (name, photo, price). It's a **reference** for browsing — when a customer checks out, the platform always uses your live product data and prices, never the table.

5. Orders and the order lifecycle

Every order moves through clear stages. You drive it forward from **Admin** → **Orders**.

Order status	Meaning	Your action
Pending payment	Order placed, not paid yet	Wait for payment proof
Payment under review	Customer sent proof	Verify the transfer
Payment confirmed	You confirmed the money arrived	Start preparing
Preparing	You're making it	Bake / pack
Ready for pickup	Pickup order is ready	Tell the customer
Out for delivery	On the way	Deliver
Delivered	Completed	Done 
Cancelled / Rejected	Order stopped	Explain to the customer

Two important points:

- **The platform records every change** with a timestamp, so you always have a trail of what happened and when.
- **Invalid jumps are blocked.** You can't mark something "delivered" before it's paid and prepared. This keeps operations honest.

Payment has its own state too: *Unpaid* → *Proof sent on WhatsApp* → *Under review* → *Confirmed* (or *Rejected*).

6. Getting paid (Moniepoint)

Sunflour uses **manual Moniepoint bank transfer** in this version. Here's the flow:

1. Customer checks out and sees your **Moniepoint account details** (managed under **Admin** → **Payment**).
2. Customer transfers the money and **sends proof on WhatsApp**.

3. You **check your Moniepoint app** to confirm the money actually arrived.
4. In **Admin** → **Orders**, you mark the payment **Confirmed** (or **Rejected** if it didn't arrive or was wrong).
5. Only then does the order move forward.

⚠ **Never confirm payment you haven't actually received.** The WhatsApp proof is a *claim*, not proof of funds. Always verify in your Moniepoint app first. Confirming and rejecting are both recorded in your audit log.

To change the bank details customers see, update **Admin** → **Payment**. Existing invoices keep the details they were created with, so old orders stay accurate.

7. Delivery, pickup and fees

Under **Admin** → **Delivery**:

- **Delivery zones** — create the areas you deliver to, each with its **base fee**.
- **Pickup** is always **free** (₦0) and never carries a surcharge.
- **Evening surcharge** — delivery orders placed **from 6:00 PM** get an extra **₦500**, unless you disable the rule. Pickup is never surcharged.

The customer always sees the delivery fee **before** paying — no surprises.

You can edit zones and fees anytime. Changes apply to **new** orders; past invoices are frozen with the fees that applied when they were placed.

8. Reviews

- Customers can submit reviews from the **Reviews** page.
- Every review arrives as **Pending** — it is **not public** until you approve it.
- Under **Admin** → **Reviews**, you **approve** or **reject** each one.
- Approving/rejecting is recorded in your audit log.

This protects your brand from spam and abuse while still showing genuine, approved feedback.

9. Emails your customers receive

The platform can send these transactional emails (no marketing/spam):

Email	When it sends
Order confirmation	After an order is placed
Purchase invoice	With the order's invoice
Order status update	When you advance the order
New order alert	To your staff inboxes, on every new order
Password reset	When an admin resets their password
Appreciation	After a delivery is completed

How email works (important):

- Emails are **queued** and sent by a small scheduled job every few minutes. This means an email may arrive a couple of minutes after the action — that's normal.
- Email is **deliberately separate from ordering**: if email ever has a problem, **orders still work perfectly**. Customers can always see their invoice on the site.
- For email to send, a few settings must be configured (see [Section 14](#)). You can check what was sent or is waiting under **Admin → Email**.

10. Your team and access

10.1 Roles

Each staff member has a role that controls what they can do:

Role	Can do
Super admin	Everything, including managing other admins and settings
Moderator	Day-to-day orders, payment review, availability, reviews
Attendant	Order operations allowed for their role
Media manager	Product photos and content (no payment/admin powers)
Customer	The normal public + their own account

Permissions are enforced on the server, so a staff member can never do more than their role allows — even if they try.

10.2 Adding a staff member (registration codes)

New admins create their own account using a **role-specific code**:

1. As a **Super admin**, open **Admin → Users** to see the **current codes** (there is one per role).
2. Share the correct code with the new staff member **privately**.
3. They go to `/admin-register`, choose their role, and enter the code to create their account.

Key facts about codes:

- Codes **change automatically every week** — old codes stop working. This is a security feature.
- You can **rotate them immediately** from **Admin → Users** if a code leaks.
- Codes only let someone *register* — they are **not** login passwords.

10.3 Removing access

Remove or deactivate a staff member from **Admin → Users**. Do this promptly when someone leaves.

11. Security and account recovery

11.1 Everyday security habits

- Use **strong, unique passwords** for every admin.
- Share registration codes **privately** (never post them publicly).
- Remove staff access as soon as someone leaves.
- Keep your domain, Vercel, Resend, and database logins safe.

11.2 The two "master keys" — back these up

Store these somewhere safe and offline (a password manager):

1. **Database connection** (`DATABASE_URL`).
2. **Admin registration code secret** (`ADMIN_REGISTRATION_CODE_SECRET`).

Together, these let your developer recover access in an emergency.

11.3 "I forgot my password and email isn't working"

You can still recover:

1. Your developer retrieves the **current Super-admin registration code** (from Admin → Users while still signed in, or by running the provided script).
2. Register a **new Super-admin** at `/admin-register` with that code and a new email — you're back in.
3. Clean up the old account afterwards.

11.4 "We lost the registration code secret"

No problem: set a **new** secret value and redeploy. From that moment the codes are generated from the new secret, the current codes appear in Admin → Users, and you can register again. (Anyone holding old codes loses access — which is exactly what you want.) This is why backing up the secret matters: losing it is recoverable, but it briefly invalidates everyone's codes.

These recovery steps are technical — your developer/Bespoke Technologies can run them quickly. The important thing for you is to **keep the two master keys backed up**.

12. Business settings and contact details

Under **Admin** → **Settings** you control the details shown across the site:

- **Business name** (shown in the header, footer, and emails).
- **Phone, WhatsApp, email, and address** (shown on Contact and in the footer).
- **Social links** (Instagram, TikTok, Facebook).
- **Maps link** for your address.

✓ **Check these carefully before launch.** The footer and the "structured data" Google reads both use these links. A broken WhatsApp number or a mistyped social URL looks unprofessional and hurts trust — fix any typos in **Admin** → **Settings** → **Business/Contacts**.

13. Getting found on Google (SEO)

The platform is built to rank well, but it needs a couple of one-time setup steps:

- It automatically produces a **sitemap** (a map of your pages, including every product) and a **robots** file that tells search engines what to index.
- Each product page has its own **title, description, and share image**.
- Your bakery's details power **rich results** (Google can show your name, area, and contact).

To finish SEO setup:

1. Make sure your live address is set as the **canonical domain** (your developer sets `NEXT_PUBLIC_APP_URL`).
2. Register the site in **Google Search Console** and **submit your sitemap** (`/sitemap.xml`).
3. Keep product names and descriptions clear and specific — that's what people search for.

14. Going live checklist

A practical checklist for launch day (your developer handles the technical items):

Domain

- ☐ Custom domain connected and `www` redirects to the main address.
- ☐ `NEXT_PUBLIC_APP_URL` set to the live domain.

Payments

- ☐ Moniepoint details correct under **Admin** → **Payment**.

Email (so notifications send)

- ☐ Email sending switched on and Resend connected.
- ☐ Sending domain verified (DKIM/SPF/DMARC records added).
- ☐ Staff alert inboxes set.
- ☐ The scheduled email job is running (test one order end-to-end).

Content

- ☐ Real products, prices, photos, and categories published.
- ☐ Delivery zones and fees set.
- ☐ Business name, contact, and social links correct.

Discoverability

- ☐ Submitted to Google Search Console with the sitemap.

Safety

- ☐ Master keys (database + code secret) backed up offline.
- ☐ At least two Super-admins exist (so you're never locked out).

15. Day-to-day operations

A simple daily rhythm:

1. **Check Orders** — confirm payments you've actually received; advance orders.
2. **Watch WhatsApp** — customers send payment proof there.
3. **Update statuses** — keep customers informed (ready / out for delivery / delivered).
4. **Moderate reviews** — approve genuine ones, reject spam.
5. **Keep the menu fresh** — mark sold-out items unavailable; add new products.

Weekly:

- Glance at the **Dashboard** numbers.
- Skim the **Audit log** for anything unexpected.
- Confirm new-order alert emails are arriving.

16. Troubleshooting & FAQ

A customer says they paid but the order didn't move. Payment is confirmed manually. Check your Moniepoint app; if the money arrived, mark the payment **Confirmed** in **Admin** → **Orders**.

Emails aren't arriving. Orders still work regardless. Check **Admin** → **Email** to see if messages are queued, and confirm email settings/domain verification with your developer. Also ask customers to check spam.

A price looks wrong to a customer. The price they pay is always the one in **Admin** → **Products** — the platform recalculates totals on the server. Update the product and the new price applies to new orders.

A staff member can't access something. That's their **role** limiting them by design. A Super-admin can adjust roles in **Admin** → **Users**.

A registration code "doesn't work". Codes rotate weekly — share the **current** code from **Admin** → **Users**. Make sure they picked the matching **role**.

I'm locked out. See [Section 11.3](#). Keep two Super-admins to avoid this.

17. Glossary

- **Admin panel** — the private management area at `/admin`.
 - **Variant** — a version of a product (e.g. a size) with its own price.
 - **Draft** — an unfinished product not shown to customers.
 - **Order status** — where an order is in its journey.
 - **Payment status** — whether money has been received and confirmed.
 - **Surcharge** — the extra ₦500 on evening deliveries.
 - **Snapshot** — the frozen copy of details on an invoice, so old orders never change when you update prices or settings later.
 - **Audit log** — the history of important admin actions.
 - **Registration code** — a weekly code used to create a new admin account.
 - **Sitemap** — the list of pages search engines use to find your content.
-

18. Support

This platform was designed, built, and handed over by:

Bespoke Technologies

Designed & Developed for Sunflour Bakery  bespoketech.com.ng

For changes, new features, or technical help — from menu tweaks to new payment methods — reach out to Bespoke Technologies. Keep your **master keys** backed up, and your platform will serve you reliably for years.
